

## Here are some symptoms you may experience with a UTI:

- **Needing to pee more frequently**, suddenly, or more urgently than usual.
- **Pain or a burning sensation** when peeing.
- **Needing to pee at night** more often than usual.
- **New pain** in the lower tummy.
- **New incontinence or wetting yourself** that is worse than usual.
- **Kidney pain** or pain in the lower back.

- **Blood** in the pee.
- **Changes in behaviour**, such as acting agitated or confused (delirium). This could be a symptom of a UTI but could also be due to other causes, which need to be ruled out.
- **General signs of infection**, like a fever, a high temperature or feeling hot and shivery, with shaking (rigors) or chills.
- **A very low temperature** below 36°C.

**You may experience fewer of these symptoms** if you have a urinary catheter.
